

Abstract of the Disclosure

A clamp includes a fitting portion to be fixed to an object to be attached; a clamp portion having a substantially U-character shape connected to the fitting portion; a first receiving portion for receiving a rod-shaped member through an insertion port; and a second receiving portion for receiving a rod-shaped member through an insertion port of the clamp portion and passing through the first receiving portion. An elastic piece extends from an inner wall of the clamp portion to hold the first rod-shaped member together with the first receiving portion. A stopper extends from the inner wall of the clamp portion to hold the second rod-shaped member together with the second receiving portion and to prevent the first rod-shaped member from entering the second receiving portion.
